

Cobra Cuffs® Application Instructions

Patented Cobra Cuffs are the only rubber based, disposable restraint which comes fully assembled and has a unique Double Lock.

The Double Lock provides additional strength and helps prevent accidental over tightening during arrest or transport -as well as tampering or shimming of the locking mechanism.

To Apply Cobra Cuffs;

- 1) First instruct the compliant subject to place their hands behind their back, palms facing outward in the prone position and insert hands into restraint openings.
- 2) Insert your finger into riveted strap loop and pull straight back to tighten. (To ensure easy application: Ensure that one hand is on the center locking block as you pull one strap to fully tighten. Adjust tension on each wrist to comfortable but secure position. Then depress Double Lock as far as it will go for each wrist.

For Prisoner Transport;

Either snap break-away riveted handle by pulling laterally or simply cut strap loop with Cobra Cutter. The same cutting tool can be used to release the prisoner.

This procedure eliminates any unsafe use of a strap loop by a subject, if they are able to get their hands to the front.

Complete Control of a subject can be maintained using only one hand –giving maximum leverage to the officer. The double lock reduces the risk of accidental over tightening while allowing the officer to guide the suspect, using reasonable force.

The Unique Super Tough Polymer used in Cobra Cuffs is extremely strong with excellent cold temperature crack resistance so that they can be depended upon in all extreme weather conditions.
